Supplemental data (online only)

Figure A. Body temperature of the six cows infused at time zero with LTA in two quarters (10 μg and 100 μg), as a parameter of fever (systemic response). Values peaked at 8 h post-infusion (hpi) (median value 39.5 °C) but were back to normal at 24 hpi. Values differed significantly ($p < 0.001$) from pre-infusion values at 8 hpi.
